## Warranty

NTN warrants, to the original purchaser only, that the delivered product which is the subject of this sale (a) will conform to drawings and specifications mutually established in writing as applicable to the contract, and (b) be free from defects in material or fabrication. The duration of this warranty is one year from date of delivery. If the buyer discovers within this period a failure of the product to conform to drawings or specifications, or a defect in material or fabrication, it must promptly notify NTN in writing. In no event shall such notification be received by NTN later than 13 months from the date of delivery. Within a reasonable time after such notification, NTN will, at its option, (a) correct any failure of the product to conform to drawings, specifications or any defect in material or workmanship, with either replacement or repair of the product, or (b) refund, in part or in whole, the purchase price. Such replacement and repair, excluding charges for labor, is at NTN's expense. All warranty service will be performed at service centers designated by NTN. These remedies are the purchaser's exclusive remedies for breach of warranty.

NTN does not warrant (a) any product, components or parts not manufactured by NTN, (b) defects caused by failure to provide a suitable installation environment for the product, (c) damage caused by use of the product for purposes other than those for which it was designed, (d) damage caused by disasters such as fire, flood, wind, and lightning, (e) damage caused by unauthorized attachments or modification, (f) damage during shipment, or (g) any other abuse or misuse by the purchaser.

**THE FOREGOING WARRANTIES ARE IN LIEU OF ALL OTHER WARRANTIES, EXPRESS OR IMPLIED, INCLUDING BUT NOT LIMITED TO THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE.**

In no case shall NTN be liable for any special, incidental, or consequential damages based upon breach of warranty, breach of contract, negligence, strict tort, or any other legal theory, and in no case shall total liability of NTN exceed the purchase price of the part upon which such liability is based. Such damages include, but are not limited to, loss of profits, loss of savings or revenue, loss of use of the product or any associated equipment, cost of capital, cost of any substitute equipment, facilities or services, downtime, the claims of third parties including customers, and injury to property. Some states do not allow limits on warranties, or on remedies for breach in certain transactions. In such states, the limits in this paragraph and in paragraph (2) shall apply to the extent allowable under case law and statutes in such states.

Any action for breach of warranty or any other legal theory must be commenced within 15 months following delivery of the goods.

Unless modified in a writing signed by both parties, this agreement is understood to be the complete and exclusive agreement between the parties, superceding all prior agreements, oral or written, and all other communications between the parties relating to the subject matter of this agreement. No employee of NTN or any other party is authorized to make any warranty in addition to those made in this agreement.

This agreement allocates the risks of product failure between NTN and the purchaser. This allocation is recognized by both parties and is reflected in the price of the goods. The purchaser acknowledges that it has read this agreement, understands it, and is bound by its terms.

## Bearings with solid grease

(For food machinery)

### Overview

“Solid grease” is a lubricant essentially composed of lubricating grease and ultra-high polymer polyethylene. Solid grease has the same viscosity as ordinary grease at normal temperature, but as a result of a special heat treatment process, this grease solidifies retaining a large proportion of the lubricant in it. Thanks to this solidification, the grease does not easily leak from the bearing, even when the bearing is subjected to strong vibrations or centrifugal force, helping to extend bearing life.

Table 1 Major components in solid greases

Solid grease (code)	Resin	Lubricant	Operating temperature range (°C)
General-purpose solid grease (LP03)	Ultra-high polymer polyethylene ①	Li-mineral oil grease	-20 ~ +80 (Constant use:+60 and less)
Food-grade solid grease (LP09)	Ultra-high polymer polyethylene ①	Ultra-high polymer polyethylene ②	-10 ~ +100 (Constant use:+80 and less)

① Conforms to FDA standard.

② Conforms to H-1 standard of NSF.

### Features

#### 1. Reduced lubricant leakage

Because the base oil is retained in a solid mixture, it is less likely to leak out of the bearing. During operation, temperature rise and/or centrifugal force will cause a gradual release of the base oil into the raceway groove. Eliminating grease leakage from the bearing ensures a consistent supply of lubricant and prevents contamination of the surrounding environment.

#### 2. Superior lubrication

Bearings with solid grease resist grease leakage prolonging bearing life in applications where high centrifugal force or vibration are present. The solid lubricant does not emulsify when exposed to water also extending both grease and bearing life.

#### 3. Low torque characteristics

The running torque of spot-pack bearings with solid grease is lower than that of bearings using standard lubricants. With conventional greases, a shearing resistance is created as the grease is channeled out of the raceway groove. Spot-pack bearings with solid grease do not experience shear resistance resulting in a lower running torque.

#### 4. Sealing effect

Though solid grease protects a bearing against ingress of foreign matters (water, dust, etc.), it is not a sufficient means as a sealing device. Therefore, for applications that need reliable sealing performance, we recommend the use of contact type rubber seals (deep groove ball bearings, bearing units) or other seals (other bearing types).

Bearings with solid grease for food machinery

## Bearing units stainless series (Stainless bearings + Stainless steel housing)

### Guards against corrosion

NTN bearing units in the stainless series feature ball bearings inserted into housings made of stainless that provide superior resistance to corrosion as compared to standard series cast iron units. This series is especially useful in a wide variety of applications because of the rust free properties of the housing.

Please refer to **Table 2** for materials of stainless series.

### Maintains a clean operating environment

The solid grease lubricant in the ball bearing, solely developed by NTN, reduces leakage from the bearing, significantly reducing environmental pollution.

Also this grease will not homogenize when water penetrates into the bearing raceway.

Note) It is not the bearing for clean room

Table 2 Materials

Parts		Materials
Bearing	Raceways	Martensite stainless steel (equivalent to SUS440C)
	Rolling element	Martensite stainless steel (SUS440C)
	Slinger, Retainer	Austenite stainless steel (SUS304)
	Rubber seal	Nitril rubber
	Set screw (W shape screw head)	Martensite stainless steel (SUS410)
Bearing housing		Austenite stainless steel casting (SCS13)
Cover		Austenite stainless steel (SUS304)

Note) Please refer to P14~P15 for the physical property for each material

### Bearings with food solid grease for food machinery

The bearings with solid grease type P-09 boasts a high degree of safety because its heat-solidifying grease for food machinery is composed of food-grade lubricating grease that complies with the NSF's H-1 standard (permitting accidental contact with food) and super molecular weight polyethylene approved according to an FDA (US Food and Drug Administration) standard.

### Interchangeability

The basic dimensions are the same as current NTN units and are also compatible with units from other manufacturers ISO standard.

The dimension tables for this series are shown on following pages. Pillow types are shown on page 88-89, Rhombus flange types are shown on page 182-183, The bearings are shown on page 430-431. There are specifications of the grease for food machinery and for heat-resistance in the stainless series bearing unit. Please consult NTN about the details.

## Bearing units plastic housing series

(Stainless bearings + Glass fiber reinforced plastic housing)

### Guards against corrosion

NTN bearing units in the plastic series feature ball bearings inserted into housings made of plastics that provide superior resistance to corrosion as compared to standard series cast iron units. This series is especially useful in a wide variety of applications because of the nonmagnetic and rust free properties of the housing.

Please refer to **Table 3** for materials of plastic series.

### Maintains a clean operating environment

The solid grease lubricant in the ball bearing, solely developed by NTN, reduces leakage from the bearing, significantly reducing environmental pollution. Also, the housing will not stain, nor is there paint to peel and contaminate the environment.

Note) It is not the bearing for clean room

Table 3 Materials

Parts		Materials
Bearing	Raceways	Martensite stainless steel (equivalent to SUS440C)
	Rolling element	Martensite stainless steel (SUS440C)
	Slinger, Retainer	Austenite stainless steel (SUS304)
	Rubber seal	Nitryl rubber
	Set screw (W shape screw head)	Martensite stainless steel (SUS410)
Bearing housing	Housing	Glass reinforced Polyester
	Sleeve for set bolt	Austenite stainless steel (SUS 304)
	Nut for grease fitting	Austenite stainless steel (SUS 304)
Cover		Polypropylene
Plug		Polyethylene

Note) Please refer to P14~P15 for the physical property for each material

### Light weight

Weight is reduced more than 30% to 60% over standard series units.

### Water resistant

The glass filled polyester housing not only reduces corrosion but offers better water resistance.

The dimension tables for this series are shown on following pages. Pillow types are shown on page 90-91. Rhombus flange types are shown on page 184-185. The bearings are shown on page 430-431. There are specifications of the grease for food machinery and for heat-resistance in the stainless series bearing unit. Please consult NTN about the details.

Note) Over tightening the setting bolt may deform the plastic housing. Use the tightening torque guideline listed in **Table 11.1(2)** (P51).

## Bearing units steel series (Rolled steel housing for general structures)

### Superior Housing Strength

Made of precision gas cut rolled steel, NTN steel housings offer superior strength characteristics when compared to cast iron and cast steel housings.

The housing material is SS400 of JIS G3101 (Mechanical properties of general structural rolled steel). please refer **Table 3.3** (page 14) for mechanical property.

### Consistent Microstructure

The rolled steel microstructure is more consistent than cast iron or cast steel, reducing the risk of housing fracture under severe conditions.

### Interchangeability

Rolled steel housing dimensions are consistent with cast units, allowing them to be interchanged with NTN standard housings and other manufacturers ISO standard.

In general, if both cast iron and steel series housings are within the same size range, the steel housings are considered safer. This is because they require a lower safety factor than ductile or cast iron housings (Please refer to **Table 4**). In addition, the design and shape of the steel series provides higher strength. (Solid base etc.)

Table 4 Safety factor

Material		Static load	Pepeated load		Impact load
			Pulsating	Reversed	
SS400	Rolled steel for structure	3	5	8	12
FC200	Gray cast iron	4	6	10	15
FCD450	Ductile cast iron	4	6	10	15
SC450	Cast steell	4	6	10	15

Table 5 Material strength

Material		Tensil strength <sup>*1</sup> (N/mm <sup>2</sup> )
SS400	Rolled steel for structure	400
FC200	Gray cast iron	200 <sup>*2</sup>
FCD450	Ductile cast iron	450 <sup>*2</sup>
SC450	Cast steell	450 <sup>*2</sup>

\*1 Minimum value of material standard

\*2 Respective casting pouring sample

### Applications

NTN rolled steel housings provide superior strength to cast steel and cast iron. Their ability to resist impact loads makes them suitable for applications involving heavy loads and vibration. Possible applications for NTN rolled steel housings include but are not limited to conveyors, trucks and overhead cranes at steel mills, mining machinery and pollution control equipment.

### Housing shape

There are various shapes for steel series. The dimension tables for this series are shown on following pages. Pillow types are shown on page 84-87. Thick pillow types are shown on page 98-99. Square flange types are shown on page 138-141. Square flange with spigot joint types are shown on page 148-149. Round flange with spigot joint types are shown on page 162-163. Rhombus flange type are shown on page 178-181. Take-up types are shown on page 230-233.

## NTN Triple-Sealed Bearings for Bearing Units

These reliable triple-sealed bearings are dustproof and waterproof.

They ensure a longer bearing life even when exposed to heavy airborne dust and splashes of foul water.

### 1. Construction

### Types

- **Low torque triple-sealed bearing**  
(Cylindrical-bore, set screw type)  
UC201D1LLJ through UC208D1LLJ  
UC305D1LLJ through UC320D1LLJ
- **High torque triple-sealed bearing**  
(Cylindrical-bore, set screw type)  
UC201D1LLS through UC212D1LLS  
(Square-bore type for agricultural machines)  
1AS-11/8, 4AS09-11/4, etc.

### 2. Features

#### Better dustproofing and waterproofing ensure a longer bearing life.

Triple-sealed bearings feature a secure bearing seal with three lips. This special seal offers reliable dustproofing and waterproofing superior to those of standard bearings used in bearing units. In addition, it ensures a longer service life, even when exposed to heavy airborne dust and splashes of foul water. (Patent pending)

#### Reduces maintenance cost.

A bearing life longer than that of a standard bearing unit configurations means extended maintenance intervals, greatly reduced maintenance costs (of inspection, relubrication, replacement, etc.), and increased availability of machinery.

#### Decreases price of the bearing unit and contributes to more compact machinery.

The triple-sealed bearing unit replaces conventional covered bearing units in certain operating conditions, greatly decreasing the cost of bearing units. In addition, if the cover is not required, the machinery can be made more compact.

#### Secure balled setscrew

The triple-sealed bearing is mounted on the shaft with NTN's unique balled setscrew, which features an embedded ball in its tip. Compared with knurled cup point or cup-point setscrews, the balled setscrew provides much greater resistance to loosening, as it does not readily loosen due to vibration or impact.

#### Interchangeability

The triple-sealed bearing unit conforms to the JIS (Japanese Industrial Standard) for UC-type bearings. It is not only ready to use as a relubricable bearing, but it also replaces the conventional bearing units of NTN and other manufacturers. It therefore serves as a ready replacement for existing bearing units.

In the meantime, the relubricatable type is recommended to minimize the wear of the seal lip.

### 3. Allowable Operating Temperature Range and Speed

The triple-sealed bearing can be used in a temperature range of -15°C to 100°C.

#### ● Allowable speed

Triple-sealed bearing unit  $\cdots d_n$  value : 36000

High-torque triple-sealed bearing unit  $\cdots d_n$  value : 21000

# 1. Construction

The NTN bearing unit is a combination of a radial ball bearing, seal, and a housing of high-grade cast iron or pressed steel, which comes in various shapes.

The outer surface of the bearing and the internal surface of the housing are spherical, so that the unit is self-aligning.

The inside construction of the ball bearing for the unit is such that steel balls and retainers of the same type as in series 62 and 63 of the NTN deep groove ball bearing are used. A duplex seal consisting of a combination of an oil-proof synthetic rubber seal and a slinger, unique to NTN, is provided on both sides.

Depending on the type, the following methods of fitting to the shaft are employed:

- (1) The inner ring is fastened onto the shaft in two places by set screws.
- (2) The inner ring has a tapered bore and is fitted to the shaft by means of an adapter.
- (3) In the eccentric locking collar system the inner ring is fastened to the shaft by means of eccentric grooves provided at the side of the inner ring and on the collar.

**Mounting system for bearing unit** (Please refer to P56 ~ P59 for Mounting bearing unit on the shaft)

## 2. Design Features and Advantages

### 2.1 Maintenance free type

The NTN Maintenance free bearing unit contains a high-grade lithium-based grease, good for use over a long period, which is ideally suited to sealed-type bearings. Also provided is an excellent sealing device, unique to NTN, which prevents any leakage of grease or penetration of dust and water from outside.

It is designed so that the rotation of the shaft causes the sealed-in grease to circulate through the inside space, effectively providing maximum lubrication. The lubrication effect is maintained over a long period with no need for replenishment of grease.

To summarize the advantages of the NTN maintenance free bearing unit:

- (1) As an adequate amount of good quality grease is sealed in at the time of manufacture, there is no need for replenishment. This means savings in terms of time and maintenance costs.
- (2) Since there is no need for any regreasing facilities, such as piping, a more compact design is possible.
- (3) The sealed-in design eliminates the possibility of grease leakage, which could lead to stained products.

### 2.2 Relubricatable type

The NTN relubricatable type bearing unit has an advantage over other similar units being so designed as to permit regreasing even in the case of misalignment of 2° to the right or left. The hole through which the grease fitting is mounted usually causes structural weakening of the housing.

However, as a result of extensive testing, in the NTN bearing unit the hole is positioned so as to minimize this adverse effect. In addition, the regreasing groove has been designed to minimize weakening of the housing.

While the NTN maintenance free type bearing unit is satisfactory for use under normal operating conditions in-doors, in the following circumstances it is necessary to use the relubricatable type bearing unit:

- (1) Cases where the temperature of the bearing rises above 100°C, 212°F:
- (2) Cases where there is excessive dust, but space does not permit using a bearing unit with a cover.
- (3) Cases where the bearing unit is constantly exposed to splashes of water or any other liquid, but space does not permit using a bearing unit with a cover.
- (4) Cases in which the humidity is very high, and the machine in which the bearing unit is used is run only intermittently.
- (5) Cases involving a heavy load of which the  $C_r/P_r$  value is about 10 or below, and the speed is 10 rpm or below, or the movement is oscillatory.
- (6) Cases where the number of revolutions is relatively high and the noise problem has to be considered; for example, when the bearing is used with the fan of an air conditioner.

### 2.3 Special sealing feature

#### 2.3.1 Standard bearing units

The sealing device of the ball bearing for the NTN bearing unit is a combination of a heat-resistant and oil-proof synthetic rubber seal and a slinger of an exclusive NTN design.

The seal, which is fixed in the outer ring, is steelreinforced, and its lip, in contact with the inner ring, is designed to minimize frictional torque.

The slinger is fixed to the inner ring of the bearing with which it rotates. There is a small clearance between its periphery and the outer ring.

These two types of seals on both sides of the bearing prevent grease leakage, and foreign matter is prevented from entering the bearing from outside.

Fig. 2.1

#### 2.3.2 Bearing units with covers

The NTN bearing unit with a cover consists of a standard bearing unit and an outside covering for extra protection against dust. Special consideration has been given to its design with respect to dust-proofing.

Sealing devices are provided in both the bearing and the housing, so that units of this type operate satisfactorily even in such adverse environments as flour mills, steel mills, foundries, galvanizing plants and chemical plants, where excessive dust is produced and/or liquids are used. They are also eminently suitable for outdoor environments where dust and rain are inevitable, and in heavy industrial machinery such as construction and transportation equipment.

The rubber seal of the cover contacts with the shaft by its two lips, as shown in **Fig. 2.2** and **2.3**. By filling the groove between the two lips with grease, an excellent sealing effect is obtained and, at the same time, the contacting portions of the lips are lubricated. Furthermore, the groove is so designed that when the shaft is inclined the rubber seal can move in the radial direction.

When bearing units are exposed to splashes of water rather than to dust, a drain hole (5 to 8 mm, 0.2 to 0.3 inches in diameter) is provided at the bottom of the cover, and grease should be applied to the side of the bearing itself instead of into the cover.

Fig. 2.2 Pressed steel cover

Fig. 2.3 Cast iron cover

## 2.4 Secure fitting

Fastening the bearing to the shaft is effected by tightening the ball-end set screw, situated on the inner ring. This is a unique NTN feature which prevents loosening, even if the bearing is subjected to intense vibrations and shocks.

## 2.5 Self-aligning

With the NTN bearing unit, the outer surface of the ball bearing and the inner surface of the housing are spherical, thus this bearing unit has self-aligning characteristic. Any misalignment of axis that may arise from poor workmanship on the shaft or errors in fitting will be properly adjusted.

## 2.6 Higher rated load capacity

The bearing used in the unit is of the same internal construction as those in NTN bearing series 62 and 63, and is capable of accommodating axial load as well as radial load, or composite load. The rated load capacity of this bearing is considerably higher than that of the corresponding self-aligning ball bearings used for standard plummer blocks.

## 2.7 Light weight yet strong housing

Housings for NTN bearing units come in various shapes. They consist of either high-grade cast iron, one-piece casting, or of precision finished pressed steel, the latter being lighter in weight. In either case, they are practically designed to combine lightness with maximum strength.

## 2.8 Easy mounting

The NTN bearing unit is an integrated unit consisting of a bearing and a housing.

As the bearing is prelubricated at manufacture with the correct amount of high-grade lithium base, it can be mounted on the shaft just as it is. It is sufficient to carry out a short test run after mounting.

## 2.9 Accurate fitting of the housing

In order to simplify the fitting of the pillow block and flange type bearing units, the housings are provided with a seat for a dowel pin, which may be utilized as needed.

## 2.10 Bearing replaceability

The bearing used in the NTN bearing unit is replaceable. In the event of bearing failure, a new bearing can be fitted to the existing housing.

### 3. Material

#### 3.1 Raceway and rolling element materials

Materials with high hardness and appropriate toughness are used for the inner rings, outer rings and balls of the insert bearings since large compression forces and repetitive stresses are applied to a small contact. In general Cold-rolled steel is used for the cages. For special applications, stainless steel is also available for use in the insert bearings.

#### 3.2 Housing materials

The most common materials used in NTN bearing unit housings are cast iron or steel plate, with cast iron being the standard.

For special applications, materials such as spheroidal graphite iron, structural steel, stainless steel cast iron or

plastic resin are also available for use in the housings. The chemical resistance properties of glass-fiber reinforced resin are shown in **Table 3.5**.

##### 3.2.1 Cast iron housing

NTN uses gray cast iron as the standard material for cast iron housings.

Among metallic materials cast iron has a high damping capacity, which is an ideal characteristic for mechanical components. This means cast iron, exhibits superior performance when absorbing vibration, compared with other materials. Additionally cast iron is suitable for high temperatures of up to 300C°.

##### 3.2.2 Steel plate housing

Cold-rolled steel sheet or hot-rolled mild steel sheet is used for steel plate housings.

Table 3.1 JIS G 5501 Mechanical properties of gray iron product

Code of material	Mechanical properties of separately casted test piece material

Table 3.5 Water and chemical resistance of glass fiber reinforcing resin housing (PBT)

	Chemicals	Temperature °C	Deterioration ratio <sup>1)</sup> %			Chemicals	Temperature °C	Deterioration ratio <sup>1)</sup> %	
			Number of days soaked					Number of days soaked	
			30 days	90 days				30 days	90 days
Acid	Hydrochloric acid, 10%	23	89	85	Organic solvent	Ethyl alcohol	23	99	96
	Sulfuric acid, 36%	23	97	97		Methyl alcohol	23	91	82
		60	84	60		Isopropyl alcohol	23	100	100
	Acetic acid 10%	23	88	88		Acetone	23	86	74
Alkaline	Potassium hydroacid, 5%	23	88	10		Methyl Ethyl Keton	23	90	80
	Sodium hydroacid, 10%	23	※	※		Ethyl acetate	23	96	86
	Ammonia hydroacid, 10%	23	96	87		Methylene chloride	23	54	54
Oil	Motor oil	23	100	100		ethylene glycole	23	100	100
	Brake oil	23	100	100	Sodium	Zinc chrolide 10%	23	97	94
	Gasoline (Regular)	23	100	100		Calcium chrolide 10%	23	98	98
		60	93	90		Sodium chrolide 5%	23	97	97

Remarks 1) Deterioration (%) is the strength after test divided by the strength before test.

The ※ symbol indicates that results could not be measured as the test piece dissolved.

Remarks 2) The values listed in the table are not guaranteed as they are the result of soaking without operating stresses on the sample. Because this strength data is general, it does not apply under all operating conditions. Actual housing strength will vary depending on the type and concentration of liquid, temperature, load, etc.

Table 3.6 Anti-Corrosion capability

NTN recommends ratings of ◎ to ○ for optimum corrosion resistance. ◎ ← excellent → poor ×

Materials	Condition	Atmosphere		Water		Acid		
		Dry	Wet	Natural water	Sodium water	Nitric acid	Sulfuric acid	Hydrochloric acid
Martensite stainless steel	SUS440C, SUS410	○	△	△	▲	▲	×	×
Austenite stainless steel	SUS304, SCS13	◎	◎	◎	○	◎	○	△
Polyester plastics		◎	◎	◎	◎	▲	○	○
Polypropylene, polyethylene		◎	◎	◎	◎	○	○	○
High carbon steel	SUJ2	△	▲	▲	×	×	×	×
Carbon steel, Cast iron		▲	×	×	×	×	×	×

Remarks: This data is obtained by observation of the surface conditions of materials.

Note that these anti-corrosion capabilities are altered by anti-corrosion surface treatment.

Not recommended for use in liquid.

## 4. Bearing unit part numbering

### 4.1 Bearing unit part numbering

NTN Bearing unit part numbers are in accordance with the Japanese Industrial Standard JIS. The code for the bearing type, housing type, diameter series and bore diameter are expressed from left to right within the part number.

**Example 1**

**UC P 2 05**

**Example 2**

**S - UK F 2 05 ; H2305X**

### 4.2 Insert bearing part numbering

The part number for the insert bearing matches the part number for the bearing unit.

**Example**

**UC 2 05 D1**

Each bearing unit can take any number of different ball bearing inserts. The available insert types are shown in Fig. 4.3(1)-4.3(9).

### 4.3 Housing part numbering

Housing part numbers are expressed by the housing type code, the bearing outer diameter series code and the bore diameter codes of the insert bearing that would be used for the unit.

The available housings are shown in Table 4.3(1)-4.3(9).

**Example**

**P 2 05 D1**

### 4.4 Supplemental codes

Typical supplementary codes added after the Bearing unit part number are shown below.

**Table 4.1 Supplementary code in front of basic designation**

Item	Supplementary code	Content
Cover	5	Inner diameter of cover : 5mm larger than bearing bore
	10	Inner diameter of cover : 10mm larger than bearing bore
	15	Inner diameter of cover : 15mm larger than bearing bore
	15	Inner diameter of cover : 20mm larger than bearing bore

**Table 4.2 Examples of supplementary codes**

Item	Supplementary code	Content
Housing	F	No recess in bottom, nor mounting bolt holes
	F1	No recess in bottom, but mounting bolt holes
	F2	No mounting bolt holes
	F7	No recess on the mounting bolt holes, but mounting bolt holes
For heat resistance and cold resistance	HT2	Heat resistance
	CT1	Cold resistance
Housing material	N1	Spheroidal graphite cast iron (FCD450)
Lubrication method	No code	Maintenance free type
	D1	Relubricatable type
Bearing seal	No code	Standard nitrile rubber seal
	U	Non-contact shield plate
	LLJ	Triple lip seal
Set screw	No code	Ball end set screw (Except for stainless bearing)
	W3	Cup point
	W4	Double point
	W5	Round head dog point set screw (With one piece)
	W6	Round head key bolt (With one piece)

**Example 1**

**UC P 2 05 D1 LLJ**

**Example 2**

**UC F 2 05 HT2 D1 W5**

Bearing specifications for heat resistance and cold resistance are shown on **Table 4.3**.

**Table 4.3 Bearing specifications for heat resistance and cold resistance**

Item	Code	Operating range (°C)	Grease	Bearing seal	Bearing clearance
Heat resistance	HT2	Room temp. ~180°C	Li soap + Silicone oil	Non-contact shield plate	C4
Cold resistance	CT1	-50°C ~Room temp.	Li soap + Silicone oil	Non-contact shield plate	CN

**Table 4.4 Recommended specifications (Frequent use conditions, except for general)**

Operating condition	Bearing	Housing	Cover	Notes
Heat resistance (more than 100°C)	Heat resistance bearing (Code : HT2)	—	—	Refer to <b>table 9.1</b> for grease.
Cold resistance (less than -15°C)	Cold resistance bearing (Code : CT1)			Refer to P7~P8 about detail.
Corrosion resistance	Stainless	Stainless	(It is possible to mount the cover, if necessary)	Refer to P14~P15 for material characteristics.
	Stainless	Resin		
Light-load	—	Steel plate		
Heavy-load		Ductile cast iron		
Impact and heavy load		Rolled steel		
The measures to prevent contamination (The specification depends on the surrounding environment)	Triple lip seal (Please refer P10)	—	Cast iron cover	—
			Steel plate cover	

※There are specifications expecting above table. For further details, consult NTN.

## 4.5 Special specifications

Following special specifications are supported individually and are not standard specification. For further details, consult NTN.

### 4.5.1 High temperature

The standard heat resistance bearing (Code:HT2) can be used up to MAX. 180°C and up to NTN. 200°C with special grease. In addition, NTN has a special heat resistance bearing for MAX. 250°C. For further details, consult NTN.

### 4.5.2 Surface treatment

In order to improve rust preventive, NTN has also designed special corrosion resistant bearing unit features. In addition, NTN can paint housings with various colors and paints. For further details, consult NTN.

## 4.5.3 Special parts

### (1) Parts

NTN can also supply special grease fittings outside of the standard grease fitting offering. Please refer to P44. In addition, NTN has grease fittings with tapered pipe thread for centralized lubrication. Please refer to the attached table (P529).

### (2) Plug

If the application does not require the relubrication feature on the housing, the customer can use a plug, NTN can supply housing plugs in resin or steel materials. Please refer to the attached table (P529).

### (3) Parts for higher seal performance.

NTN has designed seals that achieve a higher sealing performance. For example, the rotary shaft lip-type seal, the packing and so on.

## 4.5.4 Grease

NTN can change the grease to something other than standard to meet application and environmental conditions upon special request. Please refer to **Table 9.1**.

- Remarks 1. The codes "S-" and "C-" at the head of the type codes indicate steel plate covered bearing units and cast iron covered bearing units, respectively.
2. Single-sided closed covered bearing units made of steel and cast iron are also available. These bearing units are identified with the codes "SM-"(steel plate) and "CM-"(cast iron) at the head of the type codes, respectively.
3. "UC" type stainless steel bearings are also available. For further details, consult NTN (Stainless Series Bearing unit)

## 5. Tolerance

The tolerances of the NTN bearing units are in accordance with the following JIS specifications : JIS B 1558. 1559.

### 5.1 Tolerances of ball bearings for the unit

The tolerances of ball bearings used in the unit are shown in the following tables, 5.1 to 5.4.

Set screw type

Table 5.1 (1) Cylindrical bore (UC, UCS, AS, ASS, UEL, UELS, AEL, AELS)

Unit:  $\mu\text{m}/0.0001$  inch

Nominal bore diameter $d$				Cylindrical bore					Radial runout $K_{ia}$ (reference) (max)
over		incl.		$d_{mp}$ Deviations		$V_{dp}$ Variations	$B_s, C_s$ Deviations (reference)		
mm	inch	mm	inch	high	low	max.	high	low	
10	0.3937	18	0.7087	+15 + 6	0 0	10 4	0 0	-120 - 47

Table 5.2 Tapered bore (UK, UKS)

Unit:  $\mu\text{m}/0.0001\text{ inch}$

Nominal bore diameter $d$				$d_{mp}$ Deviations		$d_{1mp} - d_{mp}$		$V_{dp}^{1)}$
over		incl.		high	low	high	low	max.
mm	inch	mm	inch					
18	0.7087	30	1.1811	+33 +13	0 0	+21 + 8	0 0	13 5
30	1.1811	50	1.9685	+39 +15	0 0	+25 +10	0 0	16 6
50	1.9685	80	3.1496	+46 +18	0 0	+30 +12	0 0	19 7
80	3.1496	120	4.7244	+54 +21	0 0	+35 +14	0 0	22 9
120	4.7244	180	7.0866	+63 +25	0 0	+40 +16	0 0	40 16

1) Applies to all radial flat planes of inner ring tapered bore.

Note: 1. To be applied for tapered bore of 1/12.

2. Symbols of quantity or values

$d_1$ : Basic diameter at the theoretical large end of the tapered bore

$$d_1 = d + \frac{1}{12}B$$

$d_{mp}$ : Dimensional difference of the average bore diameter within the flat surface at the theoretical small-end of the tapered bore

$d_{1mp}$ : Dimensional difference of the average bore diameter within the flat surface at the theoretical large-end of the tapered bore

$V_{dp}$ : Unevenness of the bore diameter with the flat surface

$B$ : Nominal width of inner ring

$\alpha$ : Half of the tapered bore's nominal taper angle

$$\begin{aligned} \alpha &= 2^\circ 23' 9.4'' \\ &= 2.38594^\circ \\ &= 0.041643\text{rad} \end{aligned}$$

Theoretical tapered bore

Tapered bore having dimensional difference of the average bore diameter within the flat surface

Table 5.3 Outer ring

Unit:  $\mu\text{m}/0.0001\text{ inch}$

Nominal outside diameter $D$				Mean outside diameter deviation $D_m$		Radial runout $K_{ea}$ (reference)
over		incl.				
mm	inch	mm	inch	high	low	max.
18	0.7087	30	1.1811	0 0	-9 -4	15 6
30	1.1811	50	1.9685	0 0	-11 -4	20 8
50	1.9685	80	3.1496	0 0	-13 -5	25 10
80	3.1496	120	4.7244	0 0	-15 -6	35 14
120	4.7244	150	5.9055	0 0	-18 -7	40 16
150	5.9055	180	7.0866	0 0	-25 -10	45 18
180	7.0866	250	9.8425	0 0	-30 -12	50 20
250	9.8425	315	12.4016	0 0	-35 -14	60 24

Note: 1) The low deviation of outside diameter  $D_m$  does not apply within the distance of 1/4 the width of the outer ring from the side.

Eccentric locking collar

Eccentric locking collar type

Table 5.4 Eccentric locking collar

Unit: mm/inch

Nominal bore diameter $d$				Bore diameter deviation $d_s$		Small bore diameter of eccentric surface deviation $d_{2s}$		Eccentricity deviation $H_s$		Collar width deviation $B_{2s}$		Collar eccentric surface width deviation $A_{1s}$	
over		incl.

## 5.2 Tolerances of housings

Table 5.5 Spherical bore diameter of housings

Unit:  $\mu\text{m}/0.0001$  inch

Nominal spherical bore diameter $D_a$				$D_a$ Deviations $D_{am}$					
over		incl.		Tolerance class H7		Tolerance class J7		Tolerance class K7	
mm	inch	mm	inch	high	low	high	low	high	low
30	1.1811	50	1.9685	+25 +10	0 0	+14 +6	-11 -4	+7 +3	-18 -7
50	1.9685	80	3.1496	+30 +12	0 0	+18 +7	-12 -5	+9 +4	-21 -8
80	3.1496	120	4.7244	+35 +14	0 0	+22 +9	-13 -5	-	-
120	4.7244	180	7.0866	+40 +16	0 0	+26 +10	-14 -6	-	-
180	7.0866	250	9.8425	+46 +18	0 0	+30 +12	-16 -6	-	-
250	9.8425	315	12.4016	+52 +20	0 0	+36 +14	-16 -6	-	-

- Note: 1) Symbols  $D_{am}$ : Mean spherical bore diameter deviation  
 2) Dimensional tolerances for spherical bore diameter of housing are classified as H7 for clearance fit, and J7 for intermediate fit.  
 3) The housing bore diameter for a spherical OD bearing insert would use the following fit;  
 Housing bore diameter  $\leq 52\text{mm}$  : K7 fit  
 $52\text{mm} < \text{Housing bore diameter} \leq 180\text{mm}$  : J7 fit  
 Housing bore diameter  $> 180\text{mm}$  : H7 fit

Note: 1)  $H$  is the outside diameter of cartridge housings.  
 2)  $A$  is width of cartridge housings.

### 5.3 Bearing internal clearance

#### 5.3.1 Bearing internal clearance

Bearing internal clearance (initial clearance) is the amount of internal clearance a bearing has before being installed on a shaft or in a housing.

As shown in **Fig. 5.1**, when either the inner ring or the outer ring is fixed and the other ring is free to move, displacement can take place in either an axial or radial direction. This amount of displacement (radially or axially) is termed the internal clearance and, depending on the direction, is called the radial internal clearance or the axial internal clearance.

When the internal clearance of a bearing is measured, a slight measurement load is applied to the raceway so the internal clearance may be measured accurately. However, at this time, a slight amount of elastic deformation of the bearing occurs under the measurement load, and the clearance measurement value (measured clearance) is slightly larger than the true clearance. This discrepancy between the true bearing clearance and the increased amount due to the elastic deformation must be compensated for. These compensation values are given in **Table 5.11**.

The internal clearance values for each bearing class are shown in **Tables 5.13**.

**Table 5.11 Adjustment of radial internal clearance based on measured load** Unit:  $\mu\text{m}$

Nominal bore diameter $d$ (mm)		Measuring load (N)	Radial clearance increase				
over	incl.		C2	CN	C3	C4	C5
10	18	24.5	3~4	4	4	4	4
18	50	49	4~5	5	6	6	6
50	200	147	6~8	8	9	9	9

#### 5.3.2 Internal clearance selection

The internal clearance of a bearing under operating conditions (effective clearance) is usually smaller than the same bearing's initial clearance before being installed and operated. This is due to several factors including bearing fit, the difference in temperature between the inner and outer rings, etc. As a bearing's operating clearance has an effect on bearing life, heat generation, vibration, noise, etc.; care must be taken in selecting the most suitable operating clearance.

##### Effective internal clearance:

The internal clearance differential between the initial clearance and the operating (effective) clearance (the amount of clearance reduction caused by interference fits, or clearance variation due to the temperature difference between the inner and outer rings) can be calculated by the following formula:

$$\delta^{\text{eff}} = \delta_0 - (\delta_f + \delta_t) \dots\dots\dots (5.1)$$

where,

$\delta^{\text{eff}}$ : Effective internal clearance, **mm**

$\delta_0$ : Bearing internal clearance, **mm**

$\delta_f$ : Reduced amount of clearance due to interference, **mm**

$\delta_t$ : Reduced amount of clearance due to temperature differential of inner and outer rings, **mm**

##### Reduced clearance due to interference:

When bearings are installed with interference fits on shafts and in housings, the inner ring will expand and the outer ring will contract; thus reducing the bearings' internal clearance. The amount of expansion or contraction varies depending on the shape of the bearing, the shape of the shaft or housing, dimensions of the respective parts, and the type of materials used. The differential can range from approximately 70% to 90% of the effective interference.

$$\delta_f = (0.70 \sim 0.90) \cdot \Delta^{\text{def}} \dots\dots\dots (5.2)$$

where,

$\delta_f$ : Reduced amount of clearance due to interference, **mm**

$\Delta^{\text{def}}$ : Effective interference, **mm**

##### Reduced internal clearance due to inner/outer ring temperature difference:

During operation, normally the outer ring will be from 5° to 10°C cooler than the inner ring or rotating parts. However, if the cooling effect of the housing is large, the shaft is connected to a heat source, or a heated substance is conducted through the hollow shaft; the temperature difference between the two rings can be even greater. The amount of internal clearance is thus further reduced by the differential expansion of the two rings.

$$\delta_t = \alpha \cdot \Delta T \cdot D_0 \dots\dots\dots (5.3)$$

where,

$\delta$  : Amount of reduced clearance due to heat differential, **mm**

$\alpha$  : Bearing steel linear expansion coefficient  
 $12.5 \times 10^{-6}/^{\circ}\text{C}$

$\Delta T$  : Inner/outer ring temperature differential,  $^{\circ}\text{C}$

$D_o$  : Outer ring raceway diameter, **mm**

Outer ring raceway diameter,  $D_o$ , values can be approximated by using formula 8.4.

For ball bearings,

$$D_o = 0.20 (d + 4.0D) \dots\dots\dots (5.4)$$

where,

$d$  : Bearing bore diameter, **mm**

$D$  : Bearing outside diameter, **mm**

**5.3.3 Bearing internal clearance selection standards**

Theoretically, in regard to bearing life, the optimum operating internal clearance for any bearing would be a slight negative clearance after the bearing had reached normal operating temperature.

Unfortunately, under actual operating conditions, maintaining such optimum tolerances is often difficult at best. Due to various fluctuating operating conditions this slight minus clearance can quickly become a large minus, greatly lowering the life of the bearing and causing excessive heat to be generated. Therefore, an initial internal clearance which will result in a slightly greater than negative internal operating clearance should be selected.

Under normal operating conditions (e.g. normal load, fit, speed, temperature, etc.), a standard internal clearance will give a very satisfactory operating clearance.

**Table 5.12** lists non-standard clearance recommendations for various applications and operating conditions.

**Table 5.12 Examples of applications where bearing clearances other than normal clearance are used**

Operating conditions	Applications	Selected clearance
Shaft is heated and housing is cooled.	Conveyor of casting machine	C5
Shaft or inner ring is heated.	Annealing pit, Drying pit, Curing pit	C4
Allows for shaft deflection and fitting errors.	Disc harrows	C4
	Combines	C3
Tight-fitted for both inner and outer rings.	Large blowers	C3

## 6. Basic Load Rating and Life

### 6.1 Bearing life

Even in bearings operating under normal conditions, the surfaces of the raceway and rolling elements are constantly being subjected to repeated compressive stresses which cause flaking of these surfaces to occur. This flaking is due to material fatigue and will eventually cause the bearings to fail. The effective life of a bearing is usually defined in terms of the total number of revolutions a bearing can undergo before flaking of either the raceway surface or the rolling element surfaces occurs.

Other causes of bearing failure are often attributed to problems such as seizing, abrasions, cracking, chipping, gnawing, rust, etc. However, these so called "causes" of bearing failure are usually themselves caused by improper installation, insufficient or improper lubrication, faulty sealing or inaccurate bearing selection. Since the above mentioned "causes" of bearing failure can be avoided by taking the proper precautions, and are not simply caused by material fatigue, they are considered separately from the flaking aspect.

### 6.2 Basic rating life and basic dynamic load rating

A group of seemingly identical bearings when subjected to identical load and operating conditions will exhibit a wide diversity in their durability.

This "life" disparity can be accounted for by the difference in the fatigue of the bearing material itself. This disparity is considered statistically when calculating bearing life, and the basic rating life is defined as follows.

The basic rating life is based on a 90% statistical model which is expressed as the total number of revolutions 90% of the bearings, in an identical group of bearings subjected to identical operating conditions, will attain or surpass before flaking due to material fatigue occurs. For bearings operating at fixed constant speeds, the basic rating life (90% reliability) is expressed in the total number of hours of operation.

The basic dynamic load rating is an expression of the load capacity of a bearing based on a constant load which the bearing can sustain for one million revolutions (the basic life rating). For radial bearings this rating applies to pure radial loads, and for thrust bearings it refers to pure axial loads. The basic dynamic load ratings given in the bearing tables of this catalog are for bearings constructed of NTN standard bearing materials, using standard manufacturing techniques. Please consult NTN for basic load ratings of bearings constructed of special materials or using special manufacturing techniques.

The relationship between the basic rated life, the basic dynamic load rating and the bearing load is given in formula (6.1).

$$L^{10} = \left(\frac{C_r}{P_r}\right)^3 \dots\dots\dots (6.1)$$

where,

$L^{10}$ : Basic rating life  $10^6$  revolutions

$C_r$ : Basic dynamic load rating, N, lbf

$P_r$ : Equivalent dynamic load, N, lbf

The basic rated life can also be expressed in terms of hours of operation (revolution), and is calculated as shown in formula (6.2).

$$L^{10h} = 500f_h^3 \dots\dots\dots (6.2)$$

$$f_h = f_n \frac{C_r}{P_r} \dots\dots\dots (6.3)$$

$$f_n = \left(\frac{33.3}{n}\right)^{1/3} \dots\dots\dots (6.4)$$

where,

$L^{10h}$ : Basic rating life, h

$f_h$ : Life factor

$f_n$ : Speed factor

$n$ : Rotational speed,  $\text{min}^{-1}$

Formula (6.2) can also be expressed as shown in formula (6.5).

$$L^{10h} = \frac{10^6}{60n} \left(\frac{C_r}{P_r}\right)^3 \dots\dots\dots (6.5)$$

The relation between rotational speed  $n$  and speed factor  $f_n$  as well as the relation between the basic rated life  $L^{10h}$  and the life factor  $f_h$  is shown in **Fig. 6.1**.

When several bearings are incorporated in machines or equipment as complete units, all the bearings in the unit are considered as a whole when computing bearing life (see formula 6.6). The total bearing life of the unit is a life rating based on the viable lifetime of the unit before even one of the bearings fails due to rolling contact fatigue.

$$L = \frac{1}{\left(\frac{1}{L_1^{1.1}} + \frac{1}{L_2^{1.1}} + \dots\dots\dots + \frac{1}{L_n^{1.1}}\right)^{1/1.1}} \dots\dots (6.6)$$

where,

$L$ : Total life of the whole bearing assembly h

$L^1, L^2 \dots L^n$ : Rated life of bearings 1, 2,  $\dots n$ , h

In the case where load and the number of revolutions change at regulated intervals, after finding the rated life  $L^1, L^2, \dots, L^n$  under conditions of  $n^1, p^1 : n^2, p^2 : n^n, p^n$ ; the built-in life  $L^m$  can be given by the formula (6.7).

$$L^1 = \frac{10^6}{60n_1} \left( \frac{C_r}{P_1} \right)^3$$

$$L^2 = \frac{10^6}{60n_2} \left( \frac{C_r}{P_2} \right)^3$$

$$\vdots$$

$$L^n = \frac{10^6}{60n_n} \left( \frac{C_r}{P_n} \right)^3$$

$$L^m = \left( \frac{\phi_1}{L_1} + \frac{\phi_2}{L_2} + \dots + \frac{\phi_n}{L_n} \right)^{-1} \dots \dots \dots (6.7)$$

where,

$L_1, L_2, \dots, L_n$ : Rated life under condition 1, 2,  $\dots n$ , h

$n_1, n_2, \dots, n_n$ : Number of revolutions under condition 1, 2,  $\dots n$ , min<sup>-1</sup>

$P_1, P_2, \dots, P_n$ : Equivalent load under condition 1, 2,  $\dots n$ , N, lbf

$\phi_1, \phi_2, \dots, \phi_n$ : Ratio of condition 1, 2,  $\dots n$ , accounting for the total operating time

$L^m$ : Built-in life, h

Fig. 6.1 Bearing life rating scale

Table 6.1 Rating life for applications

Service classification	Machine application	Life time $L_n$
Machines used occasionally	Door mechanisms, Garage shutter	500
Equipment for short period or intermittent service interruption permissible	Household appliances, Electric hand tools, Agricultural machines, Lifting tackles in shops	4 000 ~ 8 000
Intermittent service machines-high reliability	Power-Station auxiliary equipment, Elevators, Conveyors, Deck cranes	8 000 ~ 14 000
Machines used for 8 hours a day, but not always in full operation	Ore wagon axles, Important gear units	14 000 ~ 20 000
Machines fully used for 8 hours	Blowers, General machinery in shops, Continuous operation cranes	20 000 ~ 30 000
Machines continuously used for 24 hours a day	Compressors, Pumps	50 000 ~ 60 000
Machines continuously used for 24 hours a day with maximum reliability	Power-station equipment, Water-supply equipment for urban areas, Mine ventilators	100 000 ~ 200 000

### 6.3 Machine applications and requisite life

When selecting a bearing, it is essential that the requisite life of the bearing be established in relation to the operating conditions. The requisite life of the bearing is usually determined by the type of machine the bearing is to be used in, and duration of service and operational reliability requirements. A general guide to these requisite life criteria is shown in **Table 6.1**. When determining bearing size, the fatigue life of the bearing is an important factor; however, besides bearing life, the strength and rigidity of the shaft and housing must also be taken into consideration.

### 6.4 Adjusted life rating factor based on ISO281:1990

The basic bearing life rating (90% reliability factor) can be calculated through the formulas mentioned earlier in Section 6.2. However, in some applications a bearing life factor of over 90% reliability may be required. To meet these requirements, bearing life can be lengthened by the use of specially improved bearing materials or special construction techniques. Moreover, according to elastohydrodynamic lubrication theory, it is clear that the bearing operating conditions (lubrication, temperature, speed, etc.) all exert an effect on bearing life. All these adjustment factors are taken into consideration when calculating bearing life, and using the life adjustment factor as prescribed in ISO 281, the adjusted bearing life can be arrived at.

$$L_{na} = a_1 a_2 a_3 \left( \frac{C}{P} \right)^3 \text{-----} (6.8)$$

where,

- $L_{na}$  : Adjusted rating life in millions of revolutions ( $10^6$ )
- $a_1$  : Reliability factor
- $a_2$  : Bearing characteristics factor
- $a_3$  : Operating conditions factor

#### 6.4.1 Reliability factor $a_1$

The values for the reliability adjustment factor  $a_1$  (for a reliability factor higher than 90%) can be found in **Table 6.2**.

#### 6.4.2 Bearing characteristics factor $a_2$

The life of a bearing is affected by the material type and quality as well as the manufacturing process. In this regard, the life is adjusted by the use of an  $a_2$  factor.

The basic dynamic load ratings listed in the catalog are based on NTN's standard material and process, therefore, the adjustment factor  $a_2 = 1$ . When special materials or processes are used the adjustment factor  $a_2$  can be larger than 1.

NTN bearings can generally be used up to **120°C**. If bearings are operated at a higher temperature, the bearing must be specially heat treated (stabilized) so that inadmissible dimensional change does not occur due to micro-structure change. This special heat treatment might

cause the reduction of bearing life because of a hardness change.

**Table 6.2 Reliability factor  $a_1$**

Reliability %	$L_n$	Reliability factor $a_1$
90	$L_{10}$	1.00
95	$L_5$	0.62
96	$L_4$	0.53
97	$L_3$	0.44
98	$L_2$	0.33
99	$L_1$	0.21

#### 6.4.3 Operating conditions factor $a_3$

Operating conditions factor  $a_3$  is used to compensate for when lubrication condition worsens due to rise in temperature or rotational speed, lubricant deteriorates, or becomes contaminated with foreign matter.

Generally speaking, when lubricating conditions are satisfactory, the  $a_3$  factor has a value of one; and when lubricating conditions are exceptionally favorable, and all other operating conditions are normal,  $a_3$  can have a value greater than one.

However, when lubricating conditions are particularly unfavorable and the oil film formation on the contact surfaces of the raceway and rolling elements is insufficient, the value of  $a_3$  becomes less than one. This insufficient oil film formation can be caused, for example, by the lubricating oil viscosity being too low for the operating temperature (below 13 mm<sup>2</sup>/s for ball bearings) ; or by exceptionally low rotational speed ( $n \text{ min}^{-1} \times d_b \text{ mm}$  less than 10000). For bearings used under special operating conditions, please consult NTN.

- Bearing operating temperature is too high  
 If bearing operating temperature is too high, the raceway becomes softened, thereby shortening life.  
 Life is adjusted by multiplying by the values given in **fig.6.2** as the operating condition factor according to operating temperature. This however does not apply to bearings that have been treated to stabilize dimensions.

**Fig. 6.2 Operating conditions factor according to operating temperature**

**6.5 Basic static load rating**

When stationary rolling bearings are subjected to static loads, they suffer from partial permanent deformation of the contact surfaces at the contact point between the rolling elements and the raceway. The amount of deformity increases as the load increases, and if this increase in load exceeds certain limits, the subsequent smooth operation of the bearing is impaired.

It has been found through experience that a permanent deformity of 0.0001 times the diameter of the rolling element, occurring at the most heavily stressed contact point between the raceway and the rolling elements, can be tolerated without any impairment in running efficiency.

The basic rated static load refers to a fixed static load limit at which a specified amount of permanent deformation occurs. It applies to pure radial loads for radial bearings. The maximum applied load values for contact stress occurring at the rolling element and raceway contact points are given below.

For ball bearings (for bearing unit) : 4200 Mpa.

**6.6 Allowable static equivalent load**

Generally the static equivalent load which can be permitted (see section 7.3) is limited by the basic static rated load as stated in Section 6.5. However, depending on requirements regarding friction and smooth operation, these limits may be greater or lesser than the basic static rated load.

In the following formula (6.9) and **Table 6.4** the safety factor  $S_o$  can be determined considering the maximum static equivalent load.

$$S_o = \frac{C_o}{P_{o\max}} \dots\dots\dots (6.9)$$

- where,  
 $S_o$ : Safety factor  
 $C_o$ : Basic static load rating, N, lbf  
 $P_{o\max}$ : Maximum static equivalent load, N, lbf

**Table 6.4 Minimum safety factor values  $S_o$**

Operating conditions	Ball bearings
High rotational accuracy demand	2
Normal rotating accuracy demand (Universal application)	1
Slight rotational accuracy deterioration permitted (Low speed, heavy loading, etc.)	0.5

Note :1) When vibration and/or shock loads are present, a load factor based on the shock load needs to be included in the  $P_{o\max}$  value.

## 7. Loads

### 7.1 Load acting on the bearing

It is very rare that the load on a bearing can be obtained by a simple calculation. Loads applied to the bearing generally include the weight of the rotating element itself, the load produced by the working of the machine, and the load resulting from transmission of power by the belt and gearwheel. Such loads include the radial load, which works on the bearing at right angles to its axis, and the thrust load, which works on the bearing parallel to its axis. These can work either singly or in combination. In addition, the operation of a machine inevitably produces a varying degree of vibrations and shocks. To take this into account, the theoretical value of a load is multiplied by a safety factor that has been derived from past experience. This is known as the "load factor".

$$\text{Load acting on the bearing} = \text{Load factor } f_w \times \text{Calculated load}$$

**Table 7.1** below shows the generally accepted load factors  $f_w$  which correspond to the degree of shock to which the machine is subjected.

#### 7.1.1 Load applied to the bearing by power transmission

The force working on the shaft when power is transmitted by belts, chains or gearwheels is obtained, in general, by the following formula:

$$T = 9\,550 \frac{H}{n}, 84\,500 \frac{H}{n} \dots\dots\dots (7.1)$$

$$K_t = \frac{T}{r} \dots\dots\dots (7.2)$$

where,

$T$  : Torque, **N·m**, lbf·inch.

$H$  : Transmission power, kW

$n$  : Rotational speed, min<sup>-1</sup>

$K_t$  : Transmission force (effective transmission force of belt or chain; tangential force of gearwheel), **N**, lbf

$r$  : effective radius of belt pulley, sprocket wheel or gearwheel, **m**, inch

Accordingly, the load actually applied to the shaft by the transmission force can be obtained by the following formula:

$$\text{Actual load} = \text{Factor} \times K_t \dots\dots\dots (7.3)$$

Different factors are adopted according to the transmission system in use. These will be dealt with in the following paragraphs.

#### Belt transmission

When power is transmitted by belt, the effective transmission force working on the belt pulley is calculated by formula (7.2). The term "effective transmission force of the belt" refers to the difference in tension between the tensioned side and the loose side of the belt. Therefore, to obtain the load actually acting on the shaft through the medium of the belt pulley, it is necessary to multiply the effective transmission force by a factor which takes into account the type of belt and the initial tension. This is known as the "belt factor".

**Table 7.1 Load factors**  $f_w$

Load conditions	$f_w$	Examples
Little or no shock	1 to 1.2	Machines tools, electric machines, etc.
Some degree of shock; machines with reciprocating parts	1.2 to 1.5	Vehicles, driving mechanism, metal-working machinery, steel-making machines, paper-making machinery, rubber mixing machines, hydraulic equipment, hoists, transportation machinery, power-transmission equipment, woodworking machines, printing machines, etc.
violent shocks	1.5 to 3	Agricultural machines, vibrator screens, ball and tube mills, etc.

In the case of power transmission by belts, gear wheels, etc., load factors adopted are somewhat different from the above. Factors used for power transmission by belts, gearwheels and chains, respectively, are given in the following sections.

**Table 7.2 Belt factors**  $f_b$

Belt type	$f_b$
V-belt	1.5 to 2.0
Timing belt	1.1 to 1.3
Flat belt (with tension pulley)	2.5 to 3.0
Flat belt	3.0 to 4.0

Note :In cases where the distance between shafts is short, the revolution speed is low, or where operating conditions are severe, the higher  $f_b$  values should be adopted.

**Gear transmission**

In the case of gear transmissions, the theoretical gear load can be calculated from the transmission force and the type of gear. With spur gears, only a radial load is involved; whereas, with helical gears and bevel gears, an additional axial load is present.

The simplest case is that of spur gears. In this instance, the tangential force  $K_t$  is obtained from the formula (7.2) and the radial force  $K_s$  can be obtained from the following formula:

$$K_s = K_t \cdot \tan \alpha \quad \dots\dots\dots (7.4)$$

where,

$\alpha$  : is the pressure angle of the gear.

Accordingly, the theoretical composite force,  $K_r$ , working on the gear is obtained from the following formula:

$$K_r = \sqrt{K_t^2 + K_s^2} = K_t \cdot \sec \alpha \quad \dots\dots\dots (7.5)$$

Therefore, to obtain the radial load actually working on the shaft, the theoretical composite force, as above, is multiplied by a factor in which the accuracy and the degree of precision of the gear is taken into account. This is called the "gear factor" and is represented by the symbol  $f_z$ . In **Table 7.3** is below,  $f_z$  values for spur wheels are given.

The gear factor is essentially almost the same as the previously described load factor,  $f_w$ . In some cases, however, vibrations and shocks are produced also by the machine of which the gear is a part. Here it is necessary to calculate the actual load working on the gear by further multiplying the gear load, as obtained above, by the load factor shown in **Table 7.1**, according to the degree of shock.

**Table 7.3 Gear factors  $f_z$**

Gear	$f_z$
Precision gears (tolerance 0.02 mm 0.0008 inch max., for both pitch and shape)	1.05 to 1.1
Gears finished by ordinary machining work (tolerance 0.02 to 0.1 mm, 0.0008 to 0.0039 inch for both pitch and shape)	1.1 to 1.3

**Chain transmission**

When power is transmitted by chain, the effective transmission force working on the sprocket wheel is calculated by formula (7.2). To obtain the load actually working, the effective transmission force must be multiplied by the "chain factor", 1.2 to 1.5.

**7.1.2 Distribution of the radial load**

The load acting on the shaft is distributed to the bearings which support the shaft.

In **Fig. 7.1**, the load is applied to the shaft between two bearings; in **Fig. 7.2** the load is applied to the shaft outside the two bearings. In practice, however, most cases are combinations of **Fig. 7.1** and **7.2**, and the load is usually a composite load, that is to say, a combination of radial and axial loads. Therefore they are calculated by the methods described in the following sections.

### 7.2 Dynamic equivalent radial load

For ball bearings used in the NTN unit, the basic rated dynamic loads  $C_r$  mentioned in the table of dimensions are applicable only when the load is purely radial. In practice, however, bearings are usually subjected to a composite load. As the table of dimensions is not directly applicable here, it is necessary to convert the values of the radial and axial loads into a single radial load value that would have an effect on the life of bearing equivalent to that of the actual load applied. This is known as the "dynamic equivalent radial load", and from this the life of the ball bearings for the unit is calculated. The dynamic equivalent radial load is calculated by the following formula:

$$P_r = X \cdot F_r + Y \cdot F_a \quad \dots\dots\dots (7.6)$$

where,

- $P_r$ : Dynamic equivalent radial load, **N**, lbf
- $F_r$ : Actual radial load, **N**, lbf
- $F_a$ : Actual axial load, **N**, lbf
- $X$ : Radial load factor
- $Y$ : Axial load factor

Values of  $X$  and  $Y$  are shown in **Table 7.4** below.

**Table 7.4 Dynamic equivalent radial load**

$$P_r = X \cdot F_r + Y \cdot F_a$$

$\frac{f_o \cdot F_a}{C_{or}}$	$e$	$\frac{F_a}{F_r} \leq e$		$\frac{F_a}{F_r} > e$	
		$X$	$Y$	$X$	$Y$
0.172	0.19				2.30
0.345	0.22				1.99
0.689	0.26				1.71
1.03	0.28				1.55
1.38	0.30	1	0	0.56	1.45
2.07	0.34				1.31
3.45	0.38				1.15
5.17	0.42				1.04
6.89	0.44				1.00

Note 1) The  $f_o$  factor for calculating equivalent radial load has been added to the dimensional tables in the catalog.

2)  $C_{or}$  is the basic static load rating. (See the table of dimensions.)  
 When the value of  $\frac{f_o \cdot F_a}{C_{or}}$  or  $\frac{F_a}{F_r}$  is not in conformity with those given in Table 7.4 above, find the value by interpolation.

### 7.3 Static equivalent radial load

In the case of a bearing which is stationary, rotates at a low speed of about 10 rpm, or makes slight oscillating movements, it is necessary to take into account the static equivalent radial load, which is the counterpart of the dynamic equivalent radial load of a rotating bearing. In this case, the following formula is used.

$$P_{or} = X_o \cdot F_r + Y_o \cdot F_a \quad \dots\dots\dots (7.7)$$

where,

- $P_{or}$ : Static equivalent radial load, **N**, lbf
- $F_r$ : Actual radial load, **N**, lbf
- $F_a$ : Actual axial load, **N**, lbf
- $X_o$ : Static radial load factor
- $Y_o$ : Static axial load factor

With the ball bearings for the NTN unit, the values of  $X_o$  and  $Y_o$  are  $X_o = 0.6$   $Y_o = 0.5$ .

However when only radial load is involved, or when  $F_a / F_r \leq e$ , the following values in used:

$$X_o = 1 \quad Y_o = 0$$

Accordingly, the following equation holds.

$$P_{or} = F_r \quad \dots\dots\dots (7.8)$$

## 8. Allowable Rotating Speed

The allowable speed while ensuring the safety and long life of ball bearings used in the unit is limited by their size, the circumferential speed at the point where the seal comes into contact, and the load acting on them. To indicate the allowable speed, it is customary to use the value of  $dn$  or  $d^{3/4}n$  ( $d$ : bore diameter of the bearing;  $d^m$ : diameter of the pitch circle  $\doteq (I.D. + O.D.)/2$ ,  $n$ : number of revolutions).

Problems connected with the lubrication of bearings are the generation of heat and seizures occurring at the sliding parts inside the bearing, in particular at the points where the ball is in contact with the cage, inner ring and outer rings. The contact pressure at the points where friction occurs on the cage is only slightly affected by the load acting on the bearing; the amount of heat generated there is approximately in proportion to the sliding velocity. Therefore, this sliding velocity serves as a yardstick to measure the limit of the rotating speed of the bearing. In the case of a bearing unit, however, there is another large factor that has to be taken into account – the circumferential speed at the part where the seal is in contact.

The UC type seal has an allowable speed of 10 m/s.

The graph in **Fig. 8.1** indicates the allowable.

The locking types configurations for bearing units are the set screw type insert and eccentric locking collar insert, and so on. Application conditions that include large clearance between the shaft and bearing, high speed operation, and so on, should be accounted for to avoid failure due to vibration, deformation or other modes. For those conditions, please refer to **Fig. 10.1** and **Fig. 10.5** to determine the appropriate fit condition. The allowable rotational speed can be calculated with the following equation:

UC(S),UK(S), UEL(S) type

$$n = 120000 / d$$

$n$  = Allowable speed

$d$  = Bearing bore

(For triple lip seal (LLJ) ;  $n = 36000/d.$ )

In cases where the application exceeds the allowable rotational speed, NTN recommends changing to a non-contact shield.

For further details, consult NTN.

Fig.8.1

## 9. Lubrication

As bearings in NTN bearing units have sufficient grease sealed-in at the time of manufacture, there is no need for replenishment while in use. The amount of grease necessary for lubrication is, in general, very small. With the NTN bearing units, the amount of grease occupies about a half to a third of the space inside the bearing.

### 9.1 Life of grease

The life of grease is influenced by bearing type, dimensions, operating conditions, temperatures and conditions with or without ingress of dust, water and gas, and it is also greatly different depending on mineral oil of the raw material and soap base. Fig. 9.2 is a diagram to calculate the grease life of NTN bearing units, which was prepared based on past results and experimental results at NTN with a view to safety. It is applicable where the bearing operating conditions are normal, and if type and bore of the bearing, and ratio of allowable rotational speed to the actual rotational speed are known, the grease life can be calculated as an example. The grease life calculated in

this manner is not an absolute value but should be regarded as a certain guide including a large degree of safety. As the operating temperature is higher, the grease life becomes shorter obviously. Although it can not be simply described, the life obtained on Fig. 9.2 is an approximate value for the operating temperature range of -15°C to 100°C.

### 9.2 Replenishment of grease

#### 9.2.1 Sealed-in grease

NTN bearing units feature superior sealing device and contain proper amount of lithium soap-based grease which, being suitable for long term use, is ideal for sealed-type bearings. Relubrication, therefore, is unnecessary under most operating conditions. At high temperatures, or where there is exposure to water or excessive dust, the highest quality grease is essential. Table 9.1 shows sealed-in grease brands for NTN relubrication-type bearing units. Table 9.2 shows thermal solidification type grease brands. It is advisable to use NTN recommendation grease brand when replenishing grease.

Fig.9.1 Adjustment factor  $f_L$  for bearing load

Fig.9.2

Example)

Grease life of UCP205 for radial load 1,000N and rotational speed  $3,600\text{min}^{-1}$  is calculated as below;

At first, calculate  $n_0$ .

From Fig. 9.1,  $f_L = 1.00$  for  $C_r/P_r = 14,000/1,000 = 14$

$A_0 = 250,000$  for the insert bearing

Therefore,

$$n_0 = f_L \cdot A_0/d = 1.00 \times 250,000/25 = 10,000$$

$$n_0/n = 10,000/3,600 = 2.78$$

On Fig. 9.2, if the intersection point C was found connecting A for bearing bore  $d=25$  on vertical line I and B for  $n_0/n=2.78$  on vertical line III by a straight line, the grease life is 15,000 hrs.

**Table 9.1 NTN relubrication-type sealed-in grease**

Type of unit	Code	Operating temperature range °C ※1
Standard	—	-15 ~ +100
Heat-resistance	4M ※2	-40 ~ +180
Heat-resistance	LX23	-60 ~ +300
Cold-resistance	3L ※3	-50 ~ +120
Water-resistance	L588	-40 ~ + 120
Low-speed, Heavy-load, High-temperature	L666	-20 ~ +180
Low torque	5K	-40 ~ +150
General polyube	LP03	-20 ~ +80 (Constant use : +60°C or less)
Food machinery	L791	-20 ~ +140
Polyube for food machinery	LP09	-10 ~ +100 (Constant use : +80°C or less)

NTN also has the other grease options that may be available upon request.  
 Note ※1 : Operating temperature data described a catalog value of grease supplier.  
 ※2 : Heat-resistance code "HT2" includes the use of "4M" grease.  
 ※3 : Cold-resistance code "CT1" includes the use of "3L" grease.

**9.2.2 Mixing of different kinds of grease**

Whether or not different kinds of grease may be mixed usually depends on their thickeners. The commonly used criteria are shown in **Table 9.3**. Properties which are most susceptible to influences from mixing are viscosity, dropping point and penetration. Water and heat resisting properties as well as mechanical stability are also lowered. Therefore, when mixing in a grease which is different to that which is already in use, it is essential that thickener (soap base) and the base oil be of the same group.

**Table 9.2 Mixing properties of grease**

Soap base	Ca	Na	Al	Ba	Li
Ca	○	△	△	×	△
Na	△	○	△	×	×
Al	△	△	○	×	×
Ba	×	×	×	○	×
Li	△	△	×	×	○

○ Mixing will varies depending on properties of both greases.  
 △ Mixing may produce considerable variations of properties.  
 × Mixing will cause a drastic change of properties.

**Table 9.3 Standard relubrication frequencies**

Type of bearing	Symbol	dn Value	Environmental conditions	Operating temperature °C	Relubrication interval	
					Hours	Period
Standard	D1	40 000 max	Ordinary	-15 to +80	1 500 to 3 000	6 to 12 mon.
Standard	D1	70 000 max	Ordinary	-15 to +80	1 000 to 2 000	3 to 6 mon.
Standard	D1	70 000 max	Ordinary	+80 to +100	500 to 700	1 mo.
Heat-resistant	HT2D1	70 000 max	Ordinary	+100 to +150	300 to 700	1 mo.
Heat-resistant	HT2D1	70 000 max	Ordinary	+150 to +180	100	1 wk.
Cold-resistant	CT1D1	70 000 max	Ordinary	-50 to +120	1 000 to 2 000	3 to 6 mo.
Standard	D1	70 000 max	Very dusty	-15 to +100	100 to 500	1 wk. to 1 mo.
Standard	D1	70 000 max	Exposed to water splashes	-15 to +100	30 to 100	1 day to 1 wk.

**9.2.3 Relubrication frequency**

Relubrication frequency varies with the kind and quality of grease used as well as the operation conditions. Therefore, it is difficult to establish a general rule, but under ordinary operating conditions, it is desirable that grease be replenished before one third (1/3) of its calculated life elapses. It is necessary, however, to take into consideration such factors as hardening of grease in the oil hole, making replenishment impossible; deterioration of grease while operation of the machine is suspended, and so forth.

In **Table 9.4** are shown standard relubrication frequencies. Irrespective of the calculated life of the grease, this list takes into consideration such factors as the rotational speed of the bearings, operating temperatures and environmental conditions, with a view to safety.

**9.2.4 Re- greasing**

The performance of a bearing is greatly influenced by the quantity of grease. In order to avoid over-filling, it is advisable to replenish the grease while the machine is in operation. Continue to insert grease until a little oozes out of from between the outer ring raceway and the periphery of the slinger, for optimum performance. Standard relubrication quantity is shown in **Table 9.5**. Relubrication pressure : 1- 3MPa {10 - 30kgf/cm<sup>2</sup>}

**Table 9.4 Relubrication quantity**

Bearing number		Quant.	Bearing number		Quant.
UC201D1		1.1	UC305D1		2.0

Note) Relubrication quantity of UK, UEL type is same as UC type

### 9.3 Grease fitting

NTN bearing units are, as a general rule, provided with a grease fitting, as shown in **Table 9.6**, and a grease gun is used for regreasing. However, housing with pipe tapered thread for centralized greasing use as well as button-head and pin types are also available on demand.

	※ 		
HB type	C-M, C-L type		

- Note 1: Standard grease fitting type is GA. Item marked ※, however, have GB type as standard.
- 2: IPG, PE, PG, PM, PB and PR type are categorized as P type.
- 3: FM, FE, FLG and FLR type are categorized as FL type.
- 4: FG and FSG type are categorized as FS type.
- 5: FCG type is categorized as FC type.
- 6: TG type is categorized as T type.

## 10. Shaft Designs

Although the shafts used for NTN bearing units require no particularly high standards of accuracy, it is desirable that, as far as possible, they be free from bends and flaws.

### 10.1 Set screw system bearing units

With set screw system bearing units, under normal operating conditions the inner ring is usually fitted onto the shaft by means of a clearance fit to ensure convenience of assembly. In this case the values shown in **Fig. 10.1** are appropriate dimensional tolerances for the shaft.

### Step shafts

Wherever there is a noticeably large axial load, a step shaft, as shown in **Fig. 10.2**, should, if practical, be used.

For bearing units with covers, it is recommended that the units shown in **Table 10.1** be used with shafts of the corresponding diameters, as shown in the same table.

NTN recommends the step shaft diameter of **Table 10.1**. In case of using a step shaft diameter smaller than shown in **Table 10.1**, NTN recommends the use of a spacer between the step shoulder and inner ring face.

NTN doesn't recommend the use of a step shaft with UK type bearing. If a step shaft is used with a UK type bearing, the step shoulder and the bearing can not contact

each other. UK type bearing can't support axial load.

The values of the radii of the rounded corners of these shafts are shown in **Table 10.2**.

**Table 10.1 Bearing units with covers (for use with step shafts) and shaft diameters**

**Relief in the axial direction**

Where several bearing units are fitted on the shaft, or where there is a great distance between two bearing units, one of the bearings is secured to the shaft as the "fixed-side bearing" and is subjected to both the axial and radial loads. The other is mounted on the shaft as the "free-side bearing" and is subjected only to radial load, compensating for expansion of the shaft due to a rise in temperature or for any errors in the distance between bearings that may have occurred during assembly.

If there is no free-side bearing, the bearings will be subjected to an abnormal axial load, which could cause premature breakdown.

Although it is desirable to use a cartridge-type bearing unit for the above purpose (Fig. 10.3), the following method is often employed. As illustrated in Fig. 10.4 (a) and (b), a key way is cut in the shaft, to accommodate a special set screw.

However, when the shaft speed is high, the dog point set screw may wear because of intensive vibration caused by the clearance between the bearing bore and the shaft. For this reason the dog point set screw is not suitable for blower type and similar applications. Please consult with NTN for alternatives.

It is not suitable for applications such as blowers, please consult with NTN.

When relief is provided in the axial direction by the use of screwed bolts as above, the dimensional relationships applicable are as shown in Tables 10.3 (a) and 10.3 (b) on the following pages.

Table 10.3 (a) Screwed bolt system

A) Metric series, applied to metric bore size.

Designation of bearings	Key way		Designation and size of bolts	$d_1$ mm	$X$ mm	$l$ mm	$l_1$ mm	$D$ mm	$H$ mm

UC315D1W6	16	7.5	S6W14×1.5×13	15.9	6.7	5.8	14
UC316D1W6	16	7.5	S6W14×1.5×13	15.9	6.6	5.8	14
UC317D1W6	18	8.5	S6W16×1.5×16	17.9	7.5	6.5	17
UC318D1W6	18	8	S6W16×1.5×16	17.9	7.4	6.5	17
UC319D1W6	18	8	S6W16×1.5×16	17.9	7.4	6.5	17
UC320D1W6	20	10.5	S6W18×1.5×18	19.9	9.5	8.5	19
UC321D1W6	20	10.5	S6W18×1.5×18	19.9	9.5	8.5	19
UC322D1W6	20	10	S6W18×1.5×18	19.9	9.4	8.5	19
UC324D1W6	20	10	S6W18×1.5×18	19.9	9.3	8.5	19
UC326D1W6	22	11	S6W20×1.5×25	21.9	10.4	9.5	26
UC328D1W6	22	11	S6W20×1.5×25	21.9	10.4	9.5	26

Note: The tolerance for the width (*b*) of the key way should preferably be set at the range of 0 to +0.2 mm.

### 10.2 Eccentric collar system

As in the case of the set screw system, it is usual under normal operating conditions to fit the inner ring onto the shaft by means of a clearance fit, for ease of assembly. **Fig. 10.5** shows the appropriate values of dimensional tolerances for the shaft.

**Fig 10.5 Dimensional tolerances for the shaft eccentric collar system bearing units**

### 10.3 Adapter system bearing units

Since in the case of the adapter system, the bearing unit is fastened onto the shaft by means of a sleeve, for dimensional tolerances for the shaft, h9 is applicable under all operating conditions.

Note that it is not usable under a loose fit  $\geq h9$ .

### 10.4 Mounting method of Take-up type unit

For the guide rail, adjusting bolt and nut of Take-up type unit, dimensions and machining accuracies indicated in **Table 10.4** are appropriate values.

**Table 10.4 Dimensions of guide rail, and bolt & nut**

Unit: mm

Designation	Dimension and tolerance of guide rail		$k'$	Dimension of adjusting bolt & nut			Designation	Dimension and tolerance of guide rail		$k'$	Dimension of adjusting bolt & nut		
	$e'$			$d$	$D$	$b$		$e'$			$d$	$D$	$b$

## 11. Handling of the Bearing Unit

### 11.1 Mounting of the housing

#### 11.1.1 Pillow block type and flange type

Although an advantage of the NTN bearing unit is that it can be fitted easily and will function efficiently on any part of a machine, attention must be paid to the following points in order to ensure its normal service life.

- 1) The surface on which the housing is mounted must be sufficiently rigid.
- 2) The surface on which the housing is mounted should be as flat as possible (Flatness:0.05 max. The housing should set firmly in its position). Deformation of the housing caused by incorrect mounting will in turn cause deformation of the bearing, leading to its premature breakdown.
- 3) Angle error between housing mounting face and shaft is desirable to be within  $\pm 2^\circ$  ( $\pm 1^\circ$  for outer ring narrow width type) from relationship with replenishment of grease. For unit with cover, the angle error is desirable to be as small as possible within  $\pm 1^\circ$  to ensure the sealing performance for the cover.

Fig. 11.1

Fig. 11.2

- 4) Excessive tightening of the mounting bolts may cause the housing to deform. Tightening the bolts to the proper torque can avoid this issue. Also, NTN recommends using a washer with the bolt when mounting the housing as the bolt alone may cause damage to the housing.

Table 11.1 (1) Tightening torque of hexagon bolt (Reference value)

**11.1.2 Cartridge type**

The inside diameter of the housing into which a cartridge type unit is inserted should be H7 under general operating conditions. It should be so furnished as to permit the bearing unit to move freely in the axial direction.

**11.2 Mounting the bearing unit on the shaft**

**11.2.1 Mounting of the set screw system unit**

To mount the set screw system bearing unit on the shaft, it is sufficient to tighten the two set screws uniformly.

The construction of the NTN "Ball-End Set Screw" is illustrated in Fig. 11.3 with the pin design that prevents it from becoming loose even when it is subjected to vibrations or impact loads.

If the fit clearance between the inner ring and the shaft is very small, it is advisable, prior to fastening on the screw, to file off that part of the shaft at which the end of the set screw (ball) strikes, by approximately 0.2 to 0.5mm 0.01 to 0.02 inches, to flatten it, as illustrated in Fig. 11.4.

This will facilitate dismounting of the bearing from the shaft should it become necessary.

Fig. 11.3

Fig. 11.4

The method of mounting the unit on the shaft is as follows:

- 1) Make certain that the end of the set screw is not protruding into the bore of the bearing.
- 2) Holding the unit at right angles to the shaft, insert the shaft into the bore of the bearing without twisting the bearing. Take care not to strike the slinger nor to subject the unit to any shock (Fig. 11.5).

Fig. 11.5

- 3) Mount housing securely in position on the machine. For the hexagon bolt, tightening torque indicated in Table 11.1 shall be recommended value.
- 4) Using tightening torque indicated in Table 11.3 as a guide, tighten the two set-screws uniformly with a torque wrench (Fig. 11.6).
- 5) Periodic retightening must be done.

Fig. 11.6

**How to securely fix the set screw**

In the case that impact load is acting on the bearing unit and the unit is operated continuously under relatively high speed ( $d_n = 30,000$  and more) and low load (such as only belt tension), it is possible to securely fix the set screw on the shaft by adding the following method.

- ① After fixing the housing, hit the housing lightly with a wooden or plastic hammer before tightening the set screw. (To prevent “sticking” of the bearing and the shaft) → To be done between procedure 3) and 4).
- ② After the test run of the equipment, tighten the set screw further with specified torque as necessary. → To be done after procedure 4).

**11.2.2 Mounting the eccentric locking collar system unit**

In this system, unlike the screw system, the shaft and inner ring are fastened together by fastening the eccentric collar in the direction of the rotation of the shaft. They are fastened together securely, and deformation of the inner ring seldom occurs. This system, however, is not recommended for applications where the direction of rotation is sometimes reversed.

Directions for mounting the unit are as follows :

- 1) Make certain that the frame in which the housing is to be mounted is suitable to the operating conditions with regard to rigidity, flatness, etc.
- 2) Make sure that the end of the shaft is not burred and that the end of the set screw in the eccentric collar is not protruding from the interior surface of the collar (**Fig. 11.7**).

Fig. 11.7

- 3) Mount the housing of the unit securely onto the frame.
- 4) Determine the relative position of the unit and the shaft accurately so that the unit will not be subjected to any thrust, and then insert the eccentric collar (**Fig. 11.8**).

Fig. 11.8

- 5) Fit the eccentric circular ridge provided on the inner ring into the eccentric circular groove of the eccentric collar, and then provisionally tighten by turning the collar by hand in the direction of the shaft (**Fig. 11.9**).

Fig. 11.9

- 6) Insert a bar into the hole provided on the periphery of the eccentric collar and tap the bar so that the collar turns in the direction of rotation of the shaft (see **Fig. 11.10**).

Fig. 11.10

- 7) Fasten the set screw of the eccentric collar onto the shaft. Recommended tightening torques are given in **Table 11.4**.

### 11.2.3 Mounting of the adapter system unit

When an adapter system unit is used, there is no danger of the fit between the shaft and the inner ring working loose even if it is subjected to impact loads or vibration. Furthermore, straight shafts may be used under any operating conditions, except where there is a large axial load.

To mount the adapter system unit onto the shaft, the procedure is as follows:

- 1) Adjust the position of the sleeve so that the tapered part comes to about the center of the bearing. To facilitate the mounting of the sleeve onto the shaft, the opening in the sleeve can be widened using a screwdriver or similar implement. The sleeve should be positioned so that the nut is located on the opposite side from the pulley, etc., for easier handling (Fig. 11.11).

Fig. 11.11

- 2) Place the bearing unit with the tapered bore properly oriented on the sleeve and abut a cylindrical sleeve against the lock nut side face of the inner ring. Tap the adapter sleeve lightly over its entire periphery, as shown in Fig. 11.12, until a positive contact is made between the bearing and the sleeve.

Fig. 11.12

- 3) Insert the washer and tighten the nut fully by hand.
- 4) Apply a jig (or screwdriver where no jig is available) to the notch of the nut and tap it with a hammer. Stop tapping after the nut has turned through from 60° to 90°. Be careful not to strike the slinger.
- Care should also be taken not to over-tighten the nut, as this will deform the inner ring, causing heat generation and seizure.
- 5) Bend up the tab on the rim of the washer, which is in line with the notch of the nut. This will prevent the nut from turning. The nut must not be turned backwards to bring the notch into line with the tab on the washer.
- 6) Mount the housing securely in position on the machine.

Note 1) These values are applied to the case of delivery state.  
 Note 2) Guideline values to be applied in the field work.

### 11.2.4 Mounting covered bearing units

For selection of the shaft, mounting the bearing onto the shaft and fitting the housing follow the same procedure as for standard bearing units. Furthermore, fitting the cover presents no special difficulty, with no need for special tools or jigs.

The procedure for mounting covered bearing units is as follows:

- 1) Remove the cover from the bearing unit. The steel cover can usually be removed easily by hand, but should there be any difficulty due to an over-tight fit, insert a screwdriver or similar tool in a twisting motion, as shown in **Fig. 11.13**.

Fig. 11.13

- 2) In order to augment the dust and waterproofing effects, completely fill the space between the two lips of the rubber seal incorporated in the cover with grease, and apply grease to the inside of the cover, filling about two-thirds of the space. Cup grease is commonly used for this purpose (**Fig. 11.14**).
- 3) First, pass one of the two grease-packed covers along the shaft, and then slide the bearing unit onto the shaft and fix the inner ring fast on the shaft before tightening the bolts holding the housing. Sometimes these steps are reversed for convenience of assembly. It is recommended that the end of the shaft be chamfered beforehand to avoid damaging the lips of the rubber seal.

Fig. 11.14

- 4) Next take the cover which has been passed along the shaft and press it into the housing as follows: Be careful not to strike the surface of the steel cover directly with a steel hammer but use a synthetic resin or wood block in between. Do not strike only in one place but tap the cover all the way round until it is firmly seated in the housing. ( Fig. 11.15)

The cast iron cover is fastened with three bolts.

- 5) Pack the second cover with grease as in step 2 and pass it along the shaft. In the case of a blind cover, the recess of the housing should be filled with grease ( Fig. 11.14).
- 6) Fit the cover into the recess of the housing using the same procedure as detailed in Step 4) ( Fig. 11.16).

Fig. 11.15

Fig. 11.16

### 11.2.5 Mounting resin covered bearing units

- ① Insert the edge of the dust cover in the housing's groove.
- ② Insert the other side of the dust cover in the opposite housing groove either by hand or with assistance of a plastic/rubber mallet/hammer.
- ③ To remove the dust cover, pry the edge from the housing groove using a screw driver or similar tool.

※Note: frequent mounting/dismounting of the dust cover may damage the edge of the housing and is not recommended.

### 11.3 Running tests

After mounting the bearing unit, check that it has been done correctly.

First, turn the shaft or the rotor by hand to make certain that it rotates smoothly. If there is no irregularity, start up the machine. Run the machine at low speed under no load and gradually bring it up to full operating speed while checking that there are no abnormalities.

Some indications of abnormality or faulty assembly are as follows:

When the shaft is turned by hand a resistance or drag is felt, or the shaft appears to become heavy or light in turn. Or, if the machine is running under power, any abnormal noise, vibration or overheating is evident.

### 11.4 Inspection during operation

Although the NTN lubrication-free bearing unit does not require refilling with grease while in use, periodic inspections are necessary to ensure safe operation of the unit's most important parts. While the interval between inspections varies from case to case, according to the degree of importance and the rate of operation, it is usually some time between two weeks and a month.

Since the inside of the bearing can be examined only by removing the slinger, seal etc., the condition of the bearing should be judged by checking for the presence of vibration, noise, overheating of the housing, etc., while the machine is running.

### 11.5 Dismounting the bearing unit

If some abnormality makes it necessary to dismount the bearing unit from the shaft in order to replace it, the procedure used to mount the bearing is followed in reverse order. In this case, special care should be given to the following points:

1) Set screw system units:

If the set screw is protruding into the bore of the bearing when the unit is withdrawn from the shaft, it will damage the shaft. Therefore the screw should be turned back fully.

2) Adapter system units:

To remove an adapter system bearing unit from the shaft, raise the tab of the washer, turn the nut two or three turns back, and apply a metal block to the nut and tap it with a hammer. Do this all round the nut, until the sleeve can be moved (**Fig. 11.17**).

If the nut is turned back too far and the screws are only slightly engaged, tapping to remove it will eventually ruin the screws.

### 11.6 Replacement of the bearing

If the bearing in the NTN bearing unit needs to be replaced, this can be carried out simply with a plummer block. There is no need to replace the housing, as it is reusable.

The bearing is changed using the following procedure: First, the set screw should be tightened as much as possible. Otherwise, there is a danger that it may catch in the housing when the bearing is tilted.

Next, insert the handle of a hammer or similar tool into the bore of the bearing and twist. Tilt the bearing through a full 90, and pull it in the direction of the notch on the housing to remove it. To install a new bearing in the housing, follow the same procedure in reverse.

Remark: 1) This series uses solid grease in the bearings as standard. A stainless steel bearing unit packed with a food grade grease or heat resistance grease is also available.

2) The basic dynamic load rating *C<sub>r</sub>* of the bearing is different from a bearing made with standard bearing steel.

Remark: 1) This series uses solid grease in the bearings as standard. A stainless steel bearing unit packed with a food grade grease or heat resistance grease is also available.  
 2) The basic dynamic load rating  $C_r$  of the bearing is different from a bearing made with standard bearing steel.

Remarks: 1) JELPL201 to JELPL205 has solid base.

2) These numbers indicate relubricatable type. If maintenance free type is needed, please order without suffix "D1".

3) JELPL208 has the same dimension as JELP208.

Note: Please refer to page 44 for size of grease fitting.

Remarks: 1) These numbers indicate relubricatable type. If maintenance free type is needed, please order without suffix "D1".

2) Adapter number with suffix "X" means a narrow slot type adapter sleeve.

In this case the lock washer with the straight inner prong should be used.

3) For HE2311XY, screw thread pitch different from the standard is applied, because of the thin thread section of sleeve.

To distinguish it, a suffix "Y" is added.

Note: Please refer to page 44 for size of grease fitting.

Remarks: 1) These numbers indicate relubricatable type. If maintenance free type is needed, please order without suffix "D1".  
 2) Adapter number with suffix "X" means a narrow slot type adapter sleeve.  
 In this case the lock washer with the straight inner prong should be used.  
 3) For HE2311XY, screw thread pitch different from the standard is applied, because of the thin thread section of sleeve.  
 To distinguish it, a suffix "Y" is added.

Note: Please refer to page 44 for size of grease fitting.

Remarks: 1) These numbers indicate relubricatable type. If maintenance free type is needed, please order without suffix "D1".

2) Adapter number with suffix "X" means a narrow slot type adapter sleeve.

In this case the lock washer with the straight inner prong should be used.

3) For HE2311XY, screw thread pitch different from the standard is applied, because of the thin thread section of sleeve.

To distinguish it, a suffix "Y" is added.

Note: Please refer to page 44 for size of grease fitting.

Remarks: 1) These numbers indicate relubricatable type. If maintenance free type is needed, please order without suffix "D1".

2) Adapter number with suffix "X" means a narrow slot type adapter sleeve.  
In this case the lock washer with the straight inner prong should be used.

3) For HE2311XY, screw thread pitch different from the standard is applied, because of the thin thread section of sleeve.  
To distinguish it, a suffix "Y" is added.

4) If the inch series housing units with dust cover are ordered with a closed end, the suffixes E, S or A are not included.  
Example: CM-UKF305D1; HE2305

Note: Please refer to page 44 for size of grease fitting.

Remarks: 1) These numbers indicate relubricatable type. If maintenance free type is needed, please order without suffix "D1".  
 2) Adapter number with suffix "X" means a narrow slot type adapter sleeve.  
 In this case the lock washer with the straight inner prong should be used.  
 3) For HE2311XY, screw thread pitch different from the standard is applied, because of the thin thread section of sleeve.  
 To distinguish it, a suffix "Y" is added.

- Remarks: 1) These numbers indicate relubricatable type. If maintenance free type is needed, please order without suffix "D1".  
 2) Adapter number with suffix "X" means a narrow slot type adapter sleeve.  
 In this case the lock washer with the straight inner prong should be used.  
 3) For HE2311XY, screw thread pitch different from the standard is applied, because of the thin thread section of sleeve.  
 To distinguish it, a suffix "Y" is added.  
 4) If the inch series housing units with dust cover are ordered with a closed end, the suffixes E, S or A are not included.  
 Example: CM-UKFS305D1; HE2305

Note: Please refer to page 44 for size of grease fitting.

Remarks: 1) These numbers indicate relubricatable type. If maintenance free type is needed, please order without suffix "D1".  
 2) Adapter number with suffix "X" means a narrow slot type adapter sleeve. In this case the lock washer with the straight inner prong should be used.  
 3) For HE2311XY, screw thread pitch different from the standard is applied, because of the thin thread section of sleeve. To distinguish it, a suffix "Y" is added.  
 4) If the inch series housing units with dust cover are ordered with a closed end, the suffixes E, S or A are not included.  
 Example: SM-UKFC205D1; HE2305

Note: Please refer to page 44 for size of grease fitting.

Remarks: 1) These numbers indicate relubricatable type. If maintenance free type is needed, please order without suffix "D1".

2) Adapter number with suffix "X" means a narrow slot type adapter sleeve.

In this case the lock washer with the straight inner prong should be used.

3) For HE2311XY, screw thread pitch different from the standard is applied, because of the thin thread section of sleeve. To distinguish it, a suffix "Y" is added.

4) If the inch series housing units with dust cover are ordered with a closed end, the suffixes E, S or A are not included.

Example: SM-UKFL205D1; HE2305

Note: Please refer to page 44 for size of grease fitting.

- Remarks: 1) These numbers indicate relubricatable type. If maintenance free type is needed, please order without suffix "D1".  
 2) Adapter number with suffix "X" means a narrow slot type adapter sleeve.  
 In this case the lock washer with the straight inner prong should be used.  
 3) For HE2311XY, screw thread pitch different from the standard is applied, because of the thin thread section of sleeve.  
 To distinguish it, a suffix "Y" is added.  
 4) If the inch series housing units with dust cover are ordered with a closed end, the suffixes E, S or A are not included.  
 Example: CM-UKFL305D1; HE2305

Note: Please refer to page 44 for size of grease fitting.

Remarks: 1) These numbers indicate relubricatable type. If maintenance free type is needed, please order without suffix "D1".

2) Adapter number with suffix "X" means a narrow slot type adapter sleeve.

In this case the lock washer with the straight inner prong should be used.

3) For HE2311XY, screw thread pitch different from the standard is applied, because of the thin thread section of sleeve.

To distinguish it, a suffix "Y" is added.

Note: Please refer to page 44 for size of grease fitting.

Remarks: 1) These numbers indicate relubricatable type. If maintenance free type is needed, please order without suffix "D1".

2) Adapter number with suffix "X" means a narrow slot type adapter sleeve.

In this case the lock washer with the straight inner prong should be used.

3) For HE2311XY, screw thread pitch different from the standard is applied, because of the thin thread section of sleeve.

To distinguish it, a suffix "Y" is added.

Note: Please refer to page 44 for size of grease fitting.

Remarks: 1) These numbers indicate relubricatable type. If maintenance free type is needed, please order without suffix "D1".  
 2) Adapter number with suffix "X" means a narrow slot type adapter sleeve.  
 In this case the lock washer with the straight inner prong should be used.  
 3) For HE2311XY, screw thread pitch different from the standard is applied, because of the thin thread section of sleeve.  
 To distinguish it, a suffix "Y" is added.

Note: Please refer to page 44 for size of grease fitting.

	UKC312D1;HS2312	6.2992	1 13/16	0.138	2.441	UK312D1;HS2312	C312D1	11
60 2 3/16 2 1/4 2 3/8	UKC313D1;H2313X	170	50	3.5	65	UK313D1;H2313X	C313D1	5.6
	UKC313D1;HA2313	6.6929	1 31/32	0.138	2.559	UK313D1;HA2313	C313D1	
	UKC313D1;HE2313X					C313D1	12	
	UKC313D1;HS2313X					C313D1		

Remarks: 1) These numbers indicate relubricatable type. If maintenance free type is needed, please order without suffix "D1".

2) Adapter number with suffix "X" means a narrow slot type adapter sleeve.

In this case the lock washer with the straight inner prong should be used.

3) For HE2311XY, screw thread pitch different from the standard is applied, because of the thin thread section of sleeve.

To distinguish it, a suffix "Y" is added.

Note: Please refer to page 44 for size of grease fitting.

Remarks: 1) These numbers indicate relubricatable type. If maintenance free type is needed, please order without suffix "D1".

2) The Stretcher Unit is designed to only take a horizontal radial load, in line with the adjustment direction. Axial loads or vertical radial loads can deform or break the housing.

Note: Please refer to page 44 for size of grease fitting.

Remarks: 1) These numbers indicate relubricatable type. If maintenance free type is needed, please order without suffix "D1".  
 2) The Stretcher Unit is designed to only take a horizontal radial load, in line with the adjustment direction. Axial loads or vertical radial loads can deform or break the housing.  
 3) In the above figure, installation of the relubrication device may be difficult, when the housing approaches the right end.  
 Note: Please refer to page 44 for size of grease fitting.

Remarks: 1) These numbers indicate relubricatable type. If maintenance free type is needed, please order without suffix "D1".  
 2) The Stretcher Unit is designed to only take a horizontal radial load, in line with the adjustment direction. Axial loads or vertical radial loads can deform or break the housing.  
 3) In the above figure, installation of the relubrication device may be difficult, when the housing approaches the right end.  
 Note: Please refer to page 44 for size of grease fitting.

Remarks: 1) Adapter number with suffix "X" means a narrow slot type adapter sleeve. In this case the lock washer with the straight inner prong should be used.  
 2) For HE2311XY, screw thread pitch different from the standard is applied, because of the thin thread section of sleeve. To distinguish it, a suffix "Y" is added.  
 3) For inch series bearings, the  $f_0$  factor for calculating equivalent radial load is the same as the metric series.

Remarks: 1) Adapter number with suffix "X" means a narrow slot type adapter sleeve.

In this case the lock washer with the straight inner prong should be used.

2) For HE2311XY, screw thread pitch different from the standard is applied, because of the thin thread section of sleeve. To distinguish it, a suffix "Y" is added.

3) For inch series bearings, the  $f_0$  factor for calculating equivalent radial load is the same as the metric series.

Basic load ratings		Factor <sup>3)</sup> $f_0$	Mass (approx.)

**Designation and dimension for joint**

Units : mm

Designation	External thread $d$	Internal thread $d_1$	$H$	$D$	Dimension across flats $B$
YG# $\frac{1}{4}$ -28UNF $\times$ PT $\frac{1}{8}$	$\frac{1}{4}$ -28UNF	PT $\frac{1}{8}$	15	11	12
YG# $\frac{1}{4}$ -28UNF $\times$ PT $\frac{1}{4}$		PT $\frac{1}{4}$	21	14	17
YG# PF $\frac{1}{8}$ $\times$ PT $\frac{1}{4}$	PF $\frac{1}{8}$	PT $\frac{1}{4}$	19	14	17
YG# PF $\frac{1}{4}$ $\times$ PT $\frac{1}{8}$	PF $\frac{1}{4}$	PT $\frac{1}{8}$	15	11	14

※The joint can't be inserted in a part of flange housing type.  
For further details, consult NTN.

**Designation and dimension for steel plug**

Units : mm

Designation	$d$	$H$	$D$
YA# $\frac{1}{4}$ -28UNF	$\frac{1}{4}$ -28UNF	4	8
YA# PF $\frac{1}{8}$	PF $\frac{1}{8}$	5	12
YA# PF $\frac{1}{4}$	PF $\frac{1}{4}$	7	15

**Designation and dimension for resin plug**

Units : mm

Designation	$D$	$L$
Y6# $\frac{1}{4}$ -28UNF	9	6
Y6# PF $\frac{1}{8}$	13	7.9
Y6# PF $\frac{1}{4}$	16	10.7

※Only room temperature
